

# Luxury Automobile Showroom Website

## Overview:

We are building a high-end, informational website for a luxury automobile showroom/reseller in Dubai. Its purpose is to showcase vehicle inventory and generate qualified sales leads. It is not a transactional e-commerce platform, there is no online payment or checkout.

**Reference site:** <https://exoticcars.ae> is to be used as a reference for structure, features, and customer journey. The design, branding, content, and code must be our own original work; this is not a clone.

## Objectives:

1. Present the full vehicle inventory in a visually premium, informative format, with search and filtering.
2. Allow non-technical showroom staff to add, edit, and remove inventory without any code changes.
3. Keep website inventory automatically in sync with the showroom's source inventory data.
4. Capture sales leads (booking / callback / enquiry) and store them for the sales team.
5. Rank well in organic search (SEO).

## Customer Journey:

The visitor journey should mirror that of the reference site: land on a premium homepage → browse featured vehicles and/or search by make/model/year → explore brand pages or the full inventory → open a detailed vehicle page → make an enquiry, request a callback or booking, or start a sell-your-car submission. The flow, navigation logic, and overall experience should follow the same pattern, expressed in our own design.

## ***Scope & Requirements:***

### **1. Vehicle Listings & Browsing:**

Rich listing pages with multiple high-quality images, full specifications, price, and description. Inventory browsing with a make / model / year search filter and per-brand landing pages. The site must handle the full inventory volume comfortably (several hundred vehicles) with fast, smooth performance.

### **2. Homepage:**

Premium landing experience with a hero video/banner, a featured-vehicles section, quick search, and brand shortcuts, comparable in structure to the reference site.

### **3. Content Management (No-Code Inventory Updates):**

A CMS / admin interface that lets non-technical showroom staff manage the entire inventory; adding, editing, and removing vehicles, images, specifications, and pricing, entirely without touching the source code. The interface must be simple enough to use confidently without significant training. The site is built once by an agency and thereafter maintained by the showroom's non-technical team.

### **4. Automated Inventory Sync:**

Inventory is maintained in a spreadsheet (Excel / Google Sheets). Changes must automatically propagate to the live site, add / update / remove, on a schedule, with validation so that a malformed row does not break a listing. This sync must also require no code changes to operate.

### **5. Lead Capture & Storage:**

Booking, callback, and general enquiry forms, plus a “Sell your car” submission flow. All enquiry data must be stored (database and/or CRM) and trigger a notification to the sales team so no lead is missed. Include a WhatsApp quick-contact option as on the reference site.

### **6. FAQ Chatbot (Rule-Based, No LLM):**

The site must include an on-site chatbot to handle common customer FAQs. It must not use an LLM or any generative AI, answers are drawn only from a predefined, editable FAQ set, guaranteeing accurate, controlled responses with no fabricated information.

- **Menu / button-driven flow:** visitors select from question categories (e.g. financing, viewing/booking, sell-your-car process, warranty, location/hours, import/export) and receive pre-written answers. Optional keyword matching so typed questions map to the nearest scripted answer.

- **Editable content:** staff must be able to add, edit, and remove FAQ questions and answers without code changes, through the same admin interface used for inventory.
- **Human fallback:** when the bot cannot answer, it offers a clear handoff. WhatsApp quick-contact, callback request, or enquiry form, so no lead is lost.
- **Consistent premium design:** the chatbot widget must match the site's luxury look and feel and work fully on mobile.
- **No unreliable data:** it must not surface live vehicle-specific prices/specs in automated answers unless reliably sourced; otherwise such queries route to a human.

## 7. Supporting Pages:

About, Contact, FAQ, showroom location/map, and optionally a Blog/Media section, as on the reference site.

## 8. SEO:

Server-rendered content, clean URLs, per-listing metadata, vehicle structured data (schema.org), a sitemap, and strong Core Web Vitals.

## 9. Design:

Premium, minimalist, and fully responsive across desktop, tablet, and mobile. Performance and polish are weighted as heavily as visual design.

## ***Explicitly Out of Scope:***

- Online payments / checkout / transactions.
- User accounts / customer logins.
- Direct copying of the reference site's design, assets, or code.
